CAM ASB38

Automatic bundler stretch-bander model "ASB38"

The CAM automatic bundler model "ASB38" is one of the simplest and most compact machines available on the market. It can solve any problem relevant to collation and bundling of cartons, bottles, trays, and various products in any arrangement.

Designed on the basis of the CAM well-proven engineering standards, the ASB38 machine gives to the users high level performances and remarkable reliability, thanks to the following technical features:

- The use of a single reel of wrapping material allows a better usage of it and a real reduction in changeover times.
- The electromechanical stretching system allows a constant band tension independent of the reel diameter.
- The single sealing position, accurately repeated on the bundle, considerably improves the package appearance.
- The sealing obtained by means of a sealing bar in conjunction with a film brake unit, guarantees an excellent uniform seal.

Inline infeed with side belts to turn cartons on edge.

Tray loading system, trays are loaded onto an indexing conveyor belt and transferred to a hopper.

The cartons are collated into the required format and transferred to the loading hopper.

The cartons are pushed up through the hopper into the tray.

The cartons and trays are pushed through the film which is then sealed around the tray and the cartons.

The collated packs can be either shrink wrapped (tunnel is available with machine) or stretch banded

Serial Number: C.11704ASB3812

Completely Refurbished by ourselves in 2002
